Gender attitudes in the world of work: cross-cultural comparison

Natalia Soboleva
Laboratory for Comparative Social Research
nsoboleva@hse.ru
November 12, 2012
With spread of emancipative values the difference between gender roles becomes vaguer but is still strongly dependent upon country characteristics. This is an expected consequence of economic development. Changing gender patterns is one of the results of growing existential security and spreading self-expression values (Inglehart & Welzel, 2010).

Values are usually regarded as factors impacting socio-economic behavior. My research underlines less explored aspect: they are themselves formed and changed in the process of economic interactions.
Key question

- **Key question**: what factors impact individual gender attitudes in the world of work and how they differ in different types of countries?

- In particular how strong is the impact of gender, characteristics of employment and education
Theoretical background

Research area:
- Influence of gender attitudes on outcomes reflecting de facto gender equality in society (Campa, Fortin, Francois&Ours, Stickney&Konrad)
- Work-family conflict (Aycan, Carnicer)
- Origin of cross-cultural differences (Alesina)
- Impact of religion on gender equality (Guiso et al.)

Conceptions:
Social role theory: people adopt the attitudes which are consistent with the roles they occupy (Eagly, Karau)
Cognitive dissonance theory: when a social role does not match the attitude, the person is likely to change either the role, or the attitude (Kroska)
Allocation of energy: women are strongly affected by their household responsibilities (Becker)
Theoretical background

- **Interest-based approach**: individuals that benefit from egalitarian work-related gender attitudes tend to share more egalitarian work-related gender attitudes. To this category refer women, work force and so on (Bolzendahl, Catherine, Myers, Daniel J., 2004, Pampel, 2011)

- **Exposure-based approach**: individuals change their ideas and attitudes when they meet the situation that discord with these ideas. In respect to gender issues it is possible to point out work-force participation, education and socialization. By socialization is meant mother’s work status and mother’s education (Bolzendahl, Catherine, Myers, Daniel J., 2004, Pampel, 2011)
Research model

Country level

- Value system
- Country wealth
- Education and LM characteristics
- Cultural, religious characteristics

Individual level

- Work-related gender attitudes
- Employment and education characteristics
- Income level (individual and household)
- Socio-demographic GENDER
Targeted Data Base

- World values survey 2005-2012 (the 5th wave)
- The targeted group of population is 20-65 (those who are likely to be involved in the world of work and have family responsibilities)
Dependent variable

The aspects of gender-related attitudes

- When jobs are scarce, men should have more right to a job than women
- A university education is more important for a boy than for a girl
- On the whole, men make better business executives than women
- On the whole, men make better political leaders than women do
- Being a housewife is just as fulfilling as working for pay
Main hypotheses

Country-level:

1. The GDP (gross domestic product) per capita promotes egalitarian work-related gender attitudes.

2. In countries where women work and earn less (with higher employment gap and wage gap) women tend to share more traditional work-related gender attitudes.

3. The level of education and especially female education contributes to development of egalitarian work-related gender attitudes.

4. The degree of religiosity stronger promotes gender attitudes than the dominant religion in the country.

5. Population of Eastern countries tends to have more traditional work-related gender attitudes that population of Western countries.

6. In countries with less clash of values (which are not in transition) the difference between men’ and women’ work-related gender attitudes is less than in countries with more clash of values experiencing transition.
Main hypotheses

Individual level:

1. Women have more egalitarian work-related gender attitudes than men.

2. Those who have a paid job, who occupy higher position (entailing supervision), perform more intellectual, creative work activities and are more independent at their job are expected to have more egalitarian work-related gender attitudes.

3. Educational attainment and higher social status are positively associated with egalitarian work-related gender attitudes, while the age and religious faith are negatively associated.

4. Family characteristics and financial situation of the household are also likely to impact work-related gender attitudes.
When jobs are scarce, men should have more right to a job than women.

Agree  Neither  Disagree
When jobs are scarce, men should have more right to a job than women
## Index construction: Exploratory factor analysis (principal component): 5 items

<table>

</tbody>
</table>
Work-related gender attitudes by family status

- Married
- Living together as married
- Divorced
- Separated
- Widowed
- Single/Never married

For men:
- Married: -0.254
- Living together as married: 0.046
- Divorced: 0.406
- Separated: 0.048
- Widowed: 0.046
- Single/Never married: 0.502

For women:
- Married: 0.09
- Living together as married: 0.051
- Divorced: -0.225
- Separated: -0.12
- Widowed: -0.178
- Single/Never married: 0.394
Gender attitudes via sector of employment

[Graph showing various sectors of employment with corresponding values]

Employer/manager of establishment with 10 or more employees
Employer/manager of establishment with less than 10 employees
Professional worker: lawyer, accountant, teacher, etc
Supervisory: office worker: supervises others
Non-manual: office worker: non-supervisory
Foreman and supervisor
Skilled manual worker
Semi-skilled manual worker
Skilled manual worker: has own farm
Agricultural worker
Member of armed forces, security personnel
Never had a job
Other (cs)
Gender attitudes via education level

No formal education
Incomplete primary school
Complete primary school
Incomplete secondary school: technical/vocational type
Complete secondary school: university-preparatory type
Some university-level education, without degree
University-level education, with degree
Human development index

- Life expectancy at birth (years)
- Mean years of schooling (years)
- Expected years of schooling
- Gross national income (GNI) per capita
Gender inequality index

1. Labour market
   - Labor force participation

2. Empowerment
   - Educational attainment (secondary level and above)
   - Parliamentary representation

3. Reproductive health
   - Adolescent fertility
   - Maternal mortality
Gender equity index

1. Education
   - Literacy rate
   - Enrolment rate in primary education
   - Enrolment rate in secondary education
   - Enrolment rate in tertiary education

2. Economic activity
   - Rate of economic activity
   - Estimated perceived income

3. Empowerment
   - % of women in technical positions
   - % of women in management and government positions
   - % of women in parliament
   - % of women in ministerial level positions
### Country level: correlations of aggregated gender attitudes

Country groupings

• Nordic countries
• Western Europe
• English-speaking countries
• Confucian
• Post-Soviet countries
• Islamic countries
• Latin America
• Africa
Target group

• Variant 1
• Taking all the population (both who work and the others)

• Variant 2
• Taking only employed (full-time, part-time and self-employed) and looking at differences between them
Data analysis

• Dependent variable: factor loadings (factor 2) for work-related gender attitudes
Independent variables

• Sex
• Age
• Degree of religiosity
• Education level
• Marriage status
• Income level

• Interaction effects (sex and marriage status, sex and education level, etc.)
Job characteristics

1. Type of tasks performed:
   - Manual or intellectual;
   - Routine or creative;
   - Degree of independence in performing tasks.

2. Type of organization

3. Supervising somebody

4. Field of employment (grouping low-skilled and high-skilled jobs)
### Preliminary regression results (employed, 20-65 years)
