

MEASUREMENT OF SOCIAL MILIEUS IN A CROSS-SECTIONAL CONTEXT

NEW PROJECT

Alexander Seymer
(alexander.seymer@sbg.ac.at)

Department of Sociology and Cultural Science
University Salzburg

The Third LCSR conference
November 13, 2013, Moscow

Aim of the project

Develop an easily applicable measurement concept of social milieus for large-scale cross-sectional data sets to account for the meso-level.

Aim of the project

Develop an easily applicable measurement concept of social milieus for large-scale cross-sectional data sets to account for the meso-level.

Definition

Milieus are groups constituted by sharing a rather stable and group specific set of values and mentalities (Hradil, 2012; Vester, 2006) with an increased level of communication amongst group members (Schulze, 2005).

Aim of the project

Develop an easily applicable measurement concept of social milieus for large-scale cross-sectional data sets to account for the meso-level.

Definition

Milieus are groups constituted by sharing a rather stable and group specific set of values and mentalities (Hradil, 2012; Vester, 2006) with an increased level of communication amongst group members (Schulze, 2005).

Three motivations:

- availability of large-scale and long-term datasets need/support integration of theoretical concepts
- progress in value theory and measurement provides grounds
- debates around societal changes (individualization, transnationalism) emphasize tensions between micro and macro context

Theoretical background

Comparative research often aims primarily on macro or micro predictors and pays only little attention to the meso-level (groups).

Theoretical background

Comparative research often aims primarily on macro or micro predictors and pays only little attention to the meso-level (groups). The traditionally strong class concept has been challenged by individualisation hypothesis (Beck, 1992) and transnationalism research.

Theoretical background

Comparative research often aims primarily on macro or micro predictors and pays only little attention to the meso-level (groups).

The traditionally strong class concept has been challenged by individualisation hypothesis (Beck, 1992) and transnationalism research.

An rarely applied alternative in quantitative studies is the milieu approach (Bourdieu, 2001).

Theoretical background

Comparative research often aims primarily on macro or micro predictors and pays only little attention to the meso-level (groups).

The traditionally strong class concept has been challenged by individualisation hypothesis (Beck, 1992) and transnationalism research.

An rarely applied alternative in quantitative studies is the milieu approach (Bourdieu, 2001).

Social groups play an important role for lay conceptualization of an increasingly complex world (Staerklé, 2009).

Theoretical background

Comparative research often aims primarily on macro or micro predictors and pays only little attention to the meso-level (groups). The traditionally strong class concept has been challenged by individualisation hypothesis (Beck, 1992) and transnationalism research.

An rarely applied alternative in quantitative studies is the milieu approach (Bourdieu, 2001).

Social groups play an important role for lay conceptualization of an increasingly complex world (Staerklé, 2009).

Contribution:

Capturing a two-dimensional space of stratification (status) and subjective motivations (values) to explain variance inside countries across milieus and similarities across countries along similar milieus.

Sieben Meta-Milieus[®] in Westeuropa

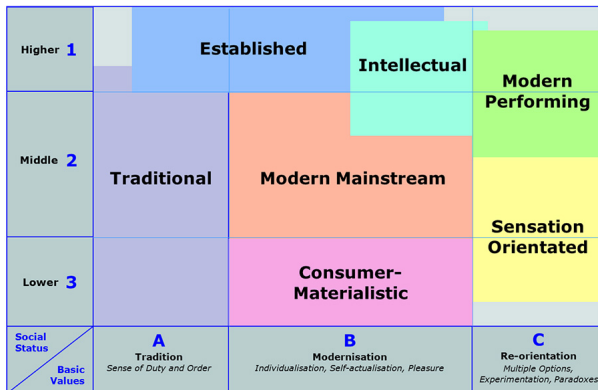

Figure: Sinus-Institut Heidelberg, 2011

Social status

International Socio-Economic Index (ISEI) of occupational status (Ganzeboom, De Graaf, Treiman, & Graaf, 1992).

Basic values

Basic Human Values Scale (HVS, see Schwartz, 1992; Schwartz & Boehnke, 2004)

Social status

International Socio-Economic Index (ISEI) of occupational status (Ganzeboom et al., 1992).

Basic values

Basic Human Values Scale (HVS, see Schwartz, 1992; Schwartz & Boehnke, 2004)

3 ways of deriving measurement:

- a priori assumptions about groups along SINUS-Milieus[©]
- Latent class analysis (poLCA)
- Cluster analysis (kmeans, Mclust, DBSCAN)

Current "narrow" approach and future path

Currently I am working with:

- European Social Survey (wave 1-6)
- Basic Human Values Scale (HVS)
- Cluster analysis (primarily assessing algorithms)

Current "narrow" approach and future path

Currently I am working with:

- European Social Survey (wave 1-6)
- Basic Human Values Scale (HVS)
- Cluster analysis (primarily assessing algorithms)

After finding clusters in ESS:

- Validation of findings by comparing the results to class and value studies (How does the measure perform? (Otte, 2008, 2005))
- Extend the operationalization to other data sets even without the HVS or ISEI.

Important questions to tackle

Theory

- Does the concept of 'social milieus' fits the aim or leads primarily to misconceptions?

Important questions to tackle

Theory

- Does the concept of 'social milieus' fits the aim or leads primarily to misconceptions?
- How to consider the 21 items from the HVS? Partially or all? As 10 values, 4 higher order structures or as two dimensional space (Verkasalo et al., 2009)?

Important questions to tackle

Theory

- Does the concept of 'social milieus' fits the aim or leads primarily to misconceptions?
- How to consider the 21 items from the HVS? Partially or all? As 10 values, 4 higher order structures or as two dimensional space (Verkasalo et al., 2009)?

Methods

- Cluster analysis vs. LCA (or both)?

Important questions to tackle

Theory

- Does the concept of 'social milieus' fits the aim or leads primarily to misconceptions?
- How to consider the 21 items from the HVS? Partially or all? As 10 values, 4 higher order structures or as two dimensional space (Verkasalo et al., 2009)?

Methods

- Cluster analysis vs. LCA (or both)?
- Density-based versus centroid-based (Some kind of fit measure, e.g. BIC)

Important questions to tackle

Theory

- Does the concept of 'social milieus' fits the aim or leads primarily to misconceptions?
- How to consider the 21 items from the HVS? Partially or all? As 10 values, 4 higher order structures or as two dimensional space (Verkasalo et al., 2009)?

Methods

- Cluster analysis vs. LCA (or both)?
- Density-based versus centroid-based (Some kind of fit measure, e.g. BIC)
- How to evaluate the performance adequately?

Otte Table 1 (Otte, 2005, p. 10)

Tabelle 2: Erklärungskraft von Klassen und Sinus-Milieus in der Studie von Zerger

	logarith. Individualeinkommen (pro Monat)	Arbeitnehmerorientierung (Index)	Einstellung zur Leistungsgerechtigkeit (Index)	Wahlverhalten BTW 1990 (4 Parteien)
	ΔR^2 in %	ΔR^2 in %	ΔR^2 in %	ΔR^2 in %
<i>Bivariate Modelle:</i>				
M1: Klassenposition	13,9	3,8	0,5	k.A.
M2: Milieuzugehörigkeit	2,9	6,0	7,9	k.A.
<i>M3 bzw. M4: Multiple Modelle mit Kontrollvariablen*:</i>				
davon: Klassenposition	2,1	1,6	0,2	k.A.
davon: Milieuzugehörigkeit	0,8	3,4	6,1	k.A.
<i>M5: Multiples Gesamtmodell:</i>				
davon: Klassenposition	(1,4)	(2,1)	(0,1)	(0,5)
davon: Milieuzugehörigkeit	0,6	3,3	6,1	1,9

Anmerkungen: Klassenposition in Anlehnung an Goldthorpe (7 Kategorien); Milieuzugehörigkeit nach Sinus (9 Kategorien). *Kontrollvariablen bei *Erklärung des Einkommens*: Erwerbsstatus, Alter, Geschlecht, Familienstand, Schulbildung und berufliche Bildung, Kapitaleinkünfte, Wohnort. Kontrollvariablen bei *Erklärung der Einstellungsindizes*: Geschlecht, Geburtskohorte, Schulbildung und berufliche Bildung, persönliches Einkommen, Kapitaleinkünfte, Wohnort. Kontrollvariablen bei *Erklärung des Wahlverhaltens*: Geschlecht, Geburtskohorte, Schulbildung und berufliche Bildung, persönliches Einkommen, Wohnort, Gewerkschaftsmitgliedschaft, Konfessionszugehörigkeit und Religiosität, Arbeitnehmerorientierung, Einstellung zur Leistungsgerechtigkeit. Die eingeklammerten Erklärungsbeiträge der Klassenposition im Gesamtmodell können geringfügige Inkonsistenzen aufweisen, weil sich die Fallzahl gegenüber dem Vergleichsmodell ohne Klassenvariable verringert. Pseudo- R^2 (P^2) definiert nach McFadden.

Quelle: Zerger (2000: 166f., 176f., 182f., 188f., 202f., 212f., 216f., 222f., 230f., 236f., 240f.); z.T. eigene Berechnungen auf der Grundlage der Angaben bei Zerger.

Table 3: Erklärungskraft von Klassen und Sinus-Milieus bei der Erklärung der Parteipräferenz in binomialen logistischen Regressionen (ΔP^2 in %)

	CDU vs. SPD (N=29910)	Grüne vs. CDU (N=18224)	Grüne vs. SPD (N=19312)	FDP vs. CDU (N=15800)	REP vs. CDU (N=14811)	Nichtwahl vs. Wahl (N=40314)
<i>Bivariate Modelle:</i>						
M1: Klassenposition	3,8	5,2	7,0	2,0	3,9	0,8
M2: Milieuzugehörigkeit	4,0	14,3	6,7	3,5	5,7	0,9
<i>M3 bzw. M4: Multiple Modelle mit Kontrollvariablen*:</i>						
davon: Klassenposition	2,5	0,8	0,5	0,6	0,8	0,3
davon: Milieuzugehörigkeit	2,8	5,9	1,5	2,0	3,0	0,6
<i>M5: Multiples Gesamtmodell:</i>						
davon: Klassenposition	1,9	0,5	0,4	0,6	0,5	0,3
davon: Milieuzugehörigkeit	2,2	5,6	1,4	2,0	2,6	0,5

Anmerkungen: Klassenposition gemessen anhand der gegenwärtigen bzw. letzten beruflichen Stellung (11 Kategorien); Milieuzugehörigkeit nach Sinus (10 Kategorien). *Kontrollvariablen: Geschlecht, Schulbildung, Konfessionszugehörigkeit und Geburtskohorte. Pseudo- R^2 (P^2) definiert nach McFadden. Alle Erklärungsbeiträge sind auf dem Ein-Prozent-Niveau statistisch signifikant.

Quelle: Eigene Berechnungen nach Otte (1998b: 95). Datenbasis: Sinus-Umfragen von 10/1995 bis 11/1996, Westdeutschland; nur Befragte mit deutscher Staatsangehörigkeit ab 18 Jahren.
