# Do divorce and separation deter social trust?

Bogdan Voicu

# Content

- Short discussion about existing literature connecting divorce and generalized trust
- Effects of “negative life events”
- Conceptual and Methodological dilemmas
  - Divorce or separation
  - Causality or selection // endogeneity
- Findings
- Implications

# Literature

divorce, generalized trust, negative life events

# Generalized trust: formation and change

## □ 1. Theories of (partial) stability

- trust as a moral value, shaped by early experiences, which remains relatively **stable** over time (Uslaner, 2002; Bekkers, 2012)

## □ 2. Theories of change

- positive and negative **life experiences** may influence how much one trusts others (Hardin, 2006; Paxton, 2007)
- **contextual** influences (Dang, 2012; Dinesen, 2013; Paxton, 2007)
- people learn trust from their social context, from social norms, from other people who are trusting (Hooghe, 2003; Newton, 1999)

# Divorce and generalized trust

- Usually: **implicit causation**, no explanation offered
  - (Bühlmann & Freitag, 2009; Kesler and Bloemraad, 2010; Polillo, 2012; Rahn et al, 2009; Sturgis & Smith, 2010)
  
- Divorce is labeled as **“negative life event”**, therefore it is harmful
  - “the experience of divorce could reduce an individual’s assessment of the goodwill of others, thereby generally lowering his view of others’ trustworthiness” (Paxton, 2007: 49).
  
- controls for **being married**:
  - without much description for the reasons (Alesina & La Ferrara, 2002; Bekkers, 2012),
  - it involves a **diversification of social networks** (Soroka et al., 2007).
  
- **Positive effects** of divorce:
  - dissolution of the couple → higher incentives to search for alternate social networks (Ermish & Gambetta, 2009).

# Consequences of Stressful Life Events/Trauma: Psychological perspectives

## Positive effects

### Theory of Cognitive Adaptation (Taylor, 1983)

actively searching to restore their psychological equilibrium, individuals convince themselves of being in control of the event

### Deviation Amplification Model (Aldwin et al, 1996)

Coping w. event → one gathers skills

### Stress Inoculation Training

(Melchenbaum, 1985, 2007)

Trauma vaccinates against the next trauma

## Negative Effects

### Cognitive reworking (Horowitz/Silver)

individuals face difficulties to rework the traumatic event

### Assumptive World Theory (Janoff-Bulman, 1992)

the traumatic event shatters the positive beliefs in a benign world

Distrust?

# How stressful divorce is?

- Being more socially acceptable (Voorpostel et al, 2011: 333), divorce is presumably less stressful and may lead to slighter changes.
- However, it is still a negative life experience (Paxton, 2007; Updegraff & Taylor, 2000), which is supposed to leave imprints on generalized trust.
- It breaks social networks (Amato, 2000), therefore producing a disruption in social life...
- It leads to loneliness and resentment (Sprecher, 1994), hopelessness (Moller et al, 2004) ...
- Simpson (1987): “few experiences in life are capable of producing more emotional distress, anguish, and suffering than is the dissolution of an **important** relationship” (p. 683).
- Interaction with the legal system (Uslaner, 2002: 46-27)

# Parental Divorce and Trust

- No direct consequences, except for family-related trust (Franklin et al, 1990)
- Negative consequences on generalized trust only if parental divorced occurred very early in childhood (0-4 years) (King, 2004)
- Mechanism: disruption of social ties

# Empirical evidences?

- *experiencing divorce, leads to a more negative view of society, which turns in lower levels of trusting others (Alessina & La Ferrara, 2002; Paxton, 2007; Rahn, Yoon and Loflin, 2003; Voicu, 2012).*
- No relation (Stolle, 1998)

# H1

- Divorce has negative impact on generalized trust

## Reasons:

- Trust changes with life events (???)
- Divorce = Negative life event (???)
- Divorce affects the nature and structure of social networks (???)

# Divorce or separation? (I)

- Apparently should be the same. They imply the rupture of a relation with implications on the related relations...

H2

- NOTE: This is not about cohabitation vs. Legal marriage.
- HOWEVER, Breaking a marriage, a registered partnership, or a cohabitation is likely to produce similar effects onto the social networks, on the positive beliefs about world and people intentions, etc.

# Divorce or separation? (II)

- If separation precedes divorce (i.e. the informal break of the tie is legalized later) ...
  - ▣ What kind of support the separated person needs? From which source?
  - ▣ Is this different when divorce is pronounced/agreed?

Henderson & Argyle, 1985: multidimensional aspect of social support. 17 types of support. Friends are more often mentioned. Depending on the type of help, the source will differ in importance.

# Divorce or separation? (III)

## □ Immediate needs in case of **separation**:

- Practical support - Typically from relatives (add reference!).

H3

Too much support → too much time to think & too much embeddedness in the kin-network → even lesser trust

- Emotional support: relatives & friends. Particularly if coming from friends, it should actually diminish the negative impact of separation

H4

# Divorce or separation? (III)

## □ Stage 2: **divorce**:

- Practical support – no longer that important. There was some time to adjust to the new situation.

H5

H6

- Emotional support: relatives & friends. Particularly if coming from friends, it should actually diminish the negative impact of separation

# Summary of hypotheses

# Hypotheses

1. Dissolution of couple  $\rightarrow$  - Trust
2. Divorce  $\equiv$  Separation
3. Separation \* Practical Support = -
4. Separation \* Emotional Support = +
5. Divorce \* Practical Support = 0
6. Divorce \* Emotional Support = +

$\rightarrow$  causality  
 $\equiv$  same effect  
- Negative effect  
+ positive effect  
0 no effect

# Data and Methods

# Data: panel data for causality

- Causality?
- One may imagine that marriage/cohabitation breaks due to lost (lack) of trust → panel data is required

		no. respondents

9%

# Method

- Fixed effects regression
  - Robust SE.
  - Controls for period effects

(RE leads to biased estimates according to the Hausman tests)
  
- Separated models for man/woman led to the same results → (I report only the models for the pooled sample)
  
- Alternative strategies for causality:
  - SEM
  - Latent Growth Models

# Variables

- Generalized trust: 11-point scale  
can't be too careful ... Most people can be trusted
  
  - Dummies for divorced, separated, single, widow
  
  - Emotional support
  - Practical support
  - Controls:
- from
- Relatives
  - Friends
  - Neighbors
- education, life satisfaction, subjective health, improving health, income\*
  - Membership in clubs, number of friends
  - life events in the previous year: illness/accident, illness/accident friend, death, conflict, threat, **splitting**

\*income was not in the initial models due to missingness. All models were repeated with income. Nothing changed

# Exact questions

- Emotional support:

*To what extent can these relatives or these children be available in case of need and show understanding, by talking with you for example, 0 means "not at all" and 10 "a great deal"?*

- Practical support:

*If necessary, in your opinion, to what extent can these neighbours provide you with practical help, this means concrete help or useful advice, if 0 means "not at all" and 10 "a great deal"?*

- Splitting : TERMINATION OF AN IMPORTANT RELATION

*Since (month-year), has a close and important relationship ended - by break-up, separation, divorce ?*

# Findings

**LIFE AFTER DIVORCE?**

*Why, yes, there is.*

# Univariate: temperature maps by waves

Number of groups = 10382

# R-square & Co.

23% of variance due to within level

4% explained variance (model 4)

- Low
- RE models: substantially increase of the  $R^2$  (but the Hausman test indicates that the estimates are significantly different; however, they are not different as interpretation)
- I did not discuss size-effects: I am not very much interested in them for the moment. However, the impact is very low... (remember that the significance levels of interaction terms were lower than 0.10, but over 0.05)

# Alternate models

- Three-ways interactions with gender → nothing changes  
(same conclusion if running the models on subsamples)
- Controlling for income: no change.
- SEM models (without interactions, for the moment) → no impact of divorce/separation on trust or of trust on couple dissolution  
[Caution: I did not test yet using SPLIT]
- LGM : idem.

# Implications

## Catalonia's Choice: Chaotic Divorce or Loveless Marriage

*wolfstreet.com / by Don Quijones / October 3, 2014*

# Basic finding

- Divorce
- развод
- Scheidung
- **Divorț**
- Rozwód
- Divorce
- Divorzio
- Divorcio
- Válás
- Echtscheidung
- Διαζύγιο
- 離婚
- Skilsmässa
- Ամուսնալուծություն
- Usaldus
- გაყრას
- Divórcio
- Розлучення

Not a simple  
causal relation!

- Trust
- Доверие
- Vertraut
- **Încredere**
- Zaufanie
- Confiance
- Fiducia
- Confianza
- Bizalom
- Vertrouwen
- Εμπιστοσύνη
- 信任
- Tillit
- Վստահել
- Lahutus
- ம்බல்
- Confiança
- Довіру

# Hypotheses?

1. Dissolution of couple  $\rightarrow$  - Trust

 but it depends

2. Divorce == Separation

 With respect to the main effect

3. Separation \* Practical Support = -

 Relatives only

4. Separation \* Emotional Support = +

5. Divorce \* Practical Support = 0

6. Divorce \* Emotional Support = +

Friends only

$\rightarrow$  causality

== same effect

- Negative effect

+ positive effect

0 no effect

# Summary of findings

- Couple dissolution is harmful to generalized trust for those who consider the relation as being **important**.
- However, the impact is rather low.
- Social support, particularly the emotional one, in case of both separation and divorce, actually boosts generalized trust. But the most important source of support differs from separation to divorce

# Further research

- Add interaction effects for the presence of children (& their age)
- Include effects of parental divorce?
- Analyze another context (UK) 
- Include contextual effects – country level
- Include the local context, the peer-group...
- Include the reasons for separation

# Implications

- Counseling: make sure that social support is to be found, particularly the emotional one.
- Research: predict TRUST rather with marriage 😊

# Cross-sectional results

# Contextual embeddedness

- The meaning of negative life experiences is shaped by their social definition
- When a negative life experience is more frequent within the population, it is reasonable to assume that preparedness to cope with it is higher, and its deterring effects are fader
- Context for divorce:
  - frequency of divorces
  - attitudes towards divorce

# Data: EVS & ESS

## EVS 2008-2009

- cross-sectional, **47** societies, ~67000 respondents
- Dependent: binary
- Independent (individuals):
  - marital status (see next slide)
  - Various controls

## ESS 2010-2011

- cross-sectional, **26** societies, ~50781 respondents
- Dependent: continuous (3-items average)
- Independent (individuals):
  - marital status (see next slide)
  - Various controls

- Independent (country level):
  - <Divorce to Marriage Ratio> or <Crude Divorce Rate>
  - Divorce=justifiable (10-point scale) → country averages
  - Control: GDP/capita
- Method: MLM
  - H3: interaction of being separated and country-level independents

# Data: EVS & ESS → marital status

## EVS 2008-2009

- Using various items one may get to:

Never married	
Married	Divorced
Registered partnership	Dissolved partnership
Cohabitation	Separation
Widow	

- (~~Experience of past separation~~)
- No info about former separation for those not in a couple;
- Several inconsistencies across items
- Info on re-marriage.

## ESS 2010-2011

- More straightforward identification of:

Never married	
Married	Divorced or Dissolved civil union
Civil union	Separation
Cohabitation	
Widow	

- (Experience of past separation)
- No info about former separation for those in a nonregistered cohabitation;
- Even more inconsistencies across items
- (Info on re-marriage)

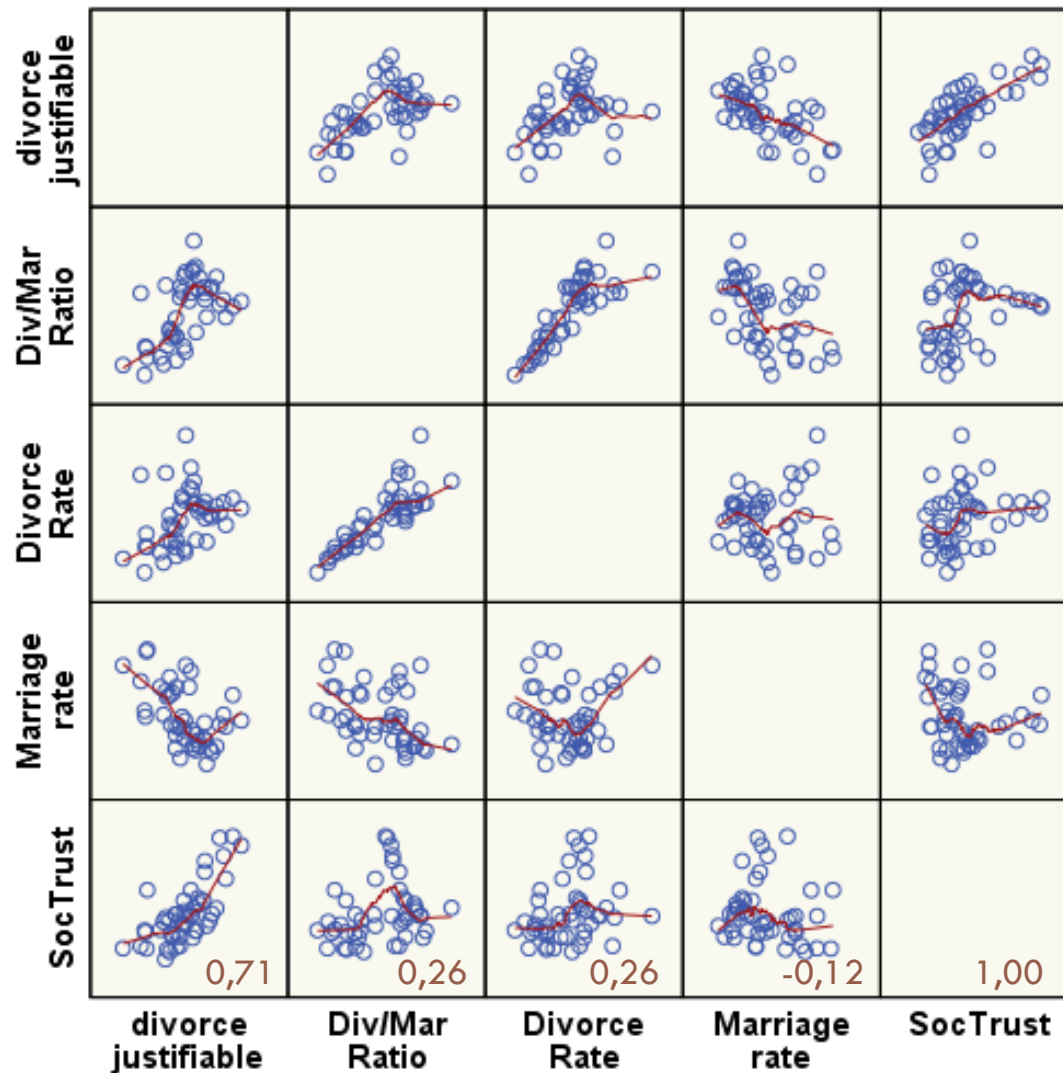

# Context: divorce justifiable

Opinion on a scale of 0 to 100: divorce can be justified (0=never 100=always)

# Bivariate country-level relations

**Pearson Correlations**  
(47 societies)

# Results EVS – MLM logistic
